BIOBUZZ autonomous lanes - team 31452 (nominal, untested)

AUDIENCE END (dashed line = alliance midline, a tile seam)

Lane assignments

P = shoots first. S = shoots second (waits for the tip).

Each alliance: P parks in the INNER slot (zone end toward midfield), S in the OUTER slot (zone end toward its wall).

Red P starts at the audience wall; blue P at the scoring wall.

Auto-SWARM: 16 points by end of AUTO

Each robot: LEAVE 3 + AUTO PARK 5. Both robots = 16 = SWARM RP at events using the default threshold (Table 10-3).

Judged at the END of AUTO: a robot touching the perimeter wall then gets no LEAVE. PARK = partly in the loading zone.

Our slots stop 5.6 in off the wall and 5.4 in into the tape.

Setup rules (G304)

Touch a wall, own half, not in the loading zone, not touching a flower, exactly 4 pollen preloaded.

Our robot starts facing the wall: it shoots out of its back.

P: square to wall; midline-side edge 3.7 in from center seam.

S: square to wall; 1.0 in gap to flower AND to center seam.

Spacer gauges allowed (G302); remove before the match (G303).

Partner timing

Our S feeds from t=15 s: partner P must finish shooting by ~14 s and clear its lane. S delay is an INIT row if needed.

Our robots first push into their wall ~0.5 s to square up.

Park-only partner: take the opposite lane and slot; end partly in the zone and OFF the wall. From mid audience wall, do not drive the straight diagonal: it hits the frame.

Drawn from FTC field CAD v26-27.2 with an 18 in robot.

Times are planned, not measured. Verify on a real field.
